Patient ID	2
Age	22
Sex / gender	Not provided
Scan date	2026-04-17T14:04:06

Scan details

Modality	Multiparametric brain MRI (registered volumes; BraTS-style modalities)
AI model	MONAI BraTS SegResNet (clinic segmentation pipeline)
Scan folder	2

Model results (this report run)

Values below are produced by the server segmentation pass that built this PDF (not a cached prior report).

Prediction	Tumor Detected
Mean class confidence	1.78%
Positive tumor voxels (mask)	146464
Estimated tumor volume	146.46 cm ³ (146464.00 mm ³)
Report generated (UTC)	2026-04-18 10:53 UTC

Findings

A tumor-associated signal abnormality is detected in the right cerebral hemisphere with an estimated volume of 146.46 cm³. The lesion is categorized as large-sized under the automated volume policy.

Estimated tumor volume: 146.46 cm³ (146464.00 mm³).

Model-predicted location (axial centroid): right cerebral hemisphere.

Severity category (volume-based): Large.

Mean class confidence (model internal): 1.78%.

AI analysis

The quantitative summary reflects voxel-wise label assignments produced by the segmentation model (mean class confidence 1.78%). Histogram entries count voxels per discrete label id in the model output space.

Class histogram (voxel counts by discrete label): {"0": 8781536, "1": 45705, "2": 36791, "4": 63968}

Reference axial MRI (same slice index used for overlay visualization).

Model overlay: tumor-associated labels projected on the reference MRI (axial).

Conclusion

The automated read is positive for tumor-associated voxels with large estimated burden. Correlation with clinical findings and standard-of-care imaging is recommended.

Important: AI-generated report. Not a substitute for professional diagnosis.
