Scan details

Modality	Multiparametric brain MRI (registered volumes; BraTS-style modalities)
AI model	MONAI BraTS MRI segmentation bundle (identical pipeline to POST /predict)
Scan folder	96402e460368413ab45147e76d2ade9f

Findings

A tumor-associated signal abnormality is detected in the right cerebral hemisphere with an estimated volume of 16.92 cm ³ . The lesion is categorized as medium-sized under the automated volume policy.
Estimated tumor volume: 16.92 cm ³ (16920.00 mm ³).
Model-predicted location (axial centroid): right cerebral hemisphere.
Severity category (volume-based): Medium.

Mean class confidence (model internal): 82.68%.

AI analysis

The quantitative summary reflects voxel-wise label assignments produced by the segmentation model (mean class confidence 82.68%). Histogram entries count voxels per discrete label id in the model output space.

Class histogram (voxel counts by discrete label): {"0": 7204112, "1": 532, "2": 16388}

Reference axial MRI (same slice index used for overlay visualization).

Model overlay: tumor-associated labels projected on the reference MRI (axial).

Conclusion

The automated read is positive for tumor-associated voxels with medium estimated burden. Correlation with clinical findings and standard-of-care imaging is recommended.

Important: AI-generated report. Not a substitute for professional diagnosis.
