

# Brain MRI — AI Segmentation Report

Generated 2026-04-16 00:00 UTC · Report ID 28

## Patient information

|              |                     |
|--------------|---------------------|
| Name         | sofia@gmail.com     |
| Patient ID   | 3                   |
| Age          | Not provided        |
| Sex / gender | Not provided        |
| Scan date    | 2026-04-15T23:55:15 |

## Scan details

|             |                                                                           |
|-------------|---------------------------------------------------------------------------|
| Modality    | Multiparametric brain MRI (registered volumes; BraTS-style modalities)    |
| AI model    | MONAI BraTS MRI segmentation bundle (identical pipeline to POST /predict) |
| Scan folder | 50                                                                        |

## Findings

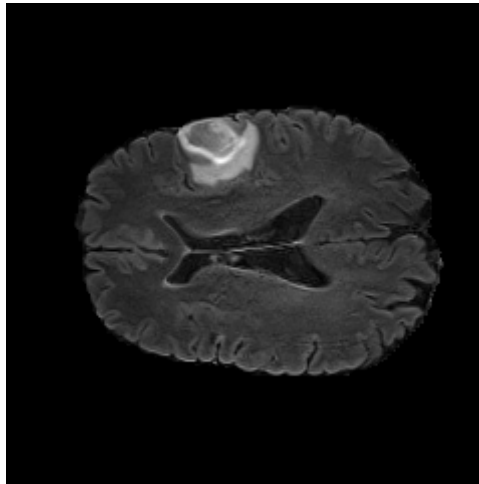

|                                                                                                                                                                                                                    |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| A tumor-associated signal abnormality is detected in the right cerebral hemisphere with an estimated volume of 30.31 cm <sup>3</sup> . The lesion is categorized as large-sized under the automated volume policy. |
| <b>Estimated tumor volume:</b> 30.31 cm <sup>3</sup> (30310.00 mm <sup>3</sup> ).                                                                                                                                  |
| <b>Model-predicted location (axial centroid):</b> right cerebral hemisphere.                                                                                                                                       |
| <b>Severity category (volume-based):</b> Large.                                                                                                                                                                    |

**Mean class confidence (model internal):** 91.27%.

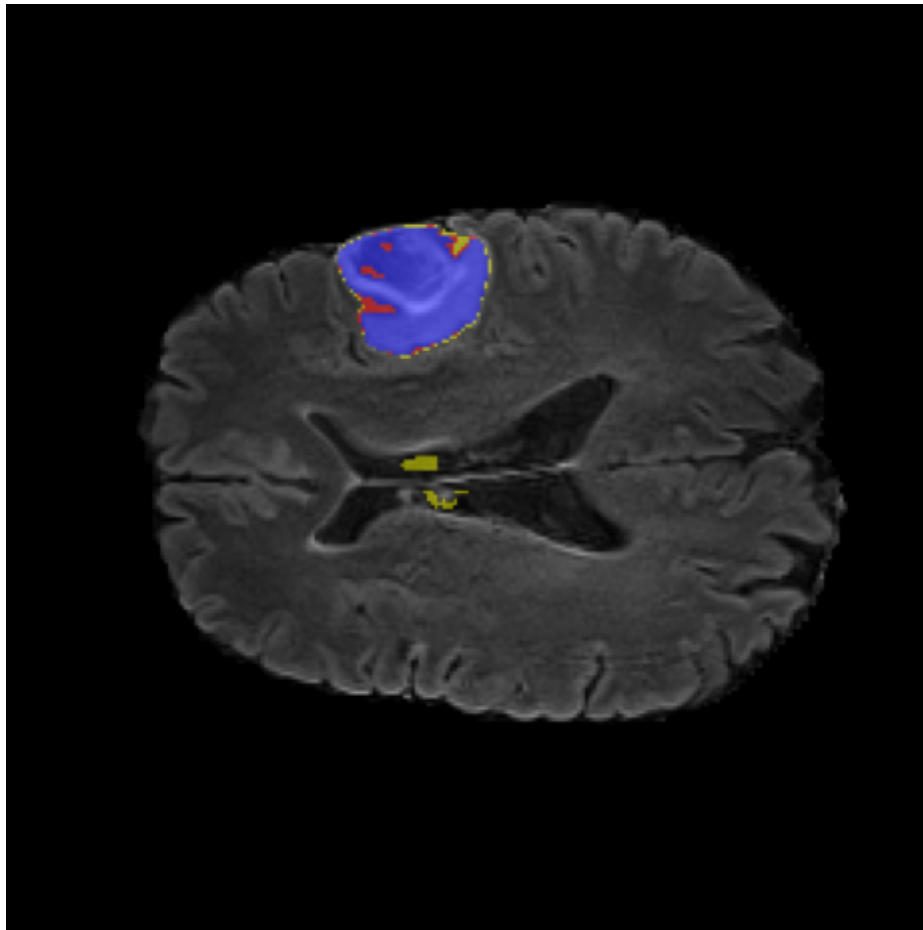

## AI analysis

The quantitative summary reflects voxel-wise label assignments produced by the segmentation model (mean class confidence 91.27%). Histogram entries count voxels per discrete label id in the model output space.

Class histogram (voxel counts by discrete label): {"0": 8897690, "1": 1771, "2": 2912, "3": 25627}

Reference axial MRI (same slice index used for overlay visualization).

Model overlay: tumor-associated labels projected on the reference MRI (axial).

## Conclusion

The automated read is positive for tumor-associated voxels with large estimated burden. Correlation with clinical findings and standard-of-care imaging is recommended.

**Important:** AI-generated report. Not a substitute for professional diagnosis.
