Scan details

Modality	Multiparametric brain MRI (registered volumes; BraTS-style modalities)
AI model	MONAI BraTS MRI segmentation bundle (identical pipeline to POST /predict)
Scan folder	52

Findings

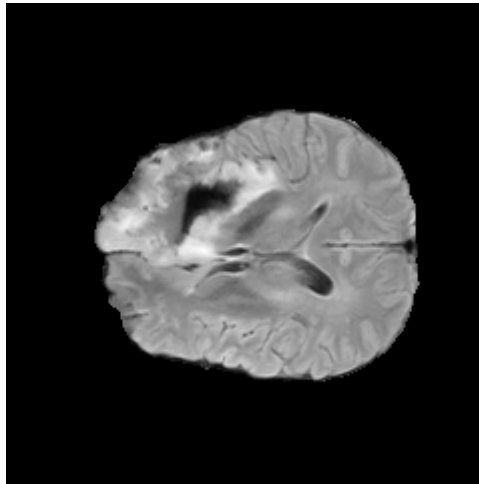

A tumor-associated signal abnormality is detected in the right cerebral hemisphere with an estimated volume of 90.13 cm ³ . The lesion is categorized as large-sized under the automated volume policy.
Estimated tumor volume: 90.13 cm ³ (90127.00 mm ³).
Model-predicted location (axial centroid): right cerebral hemisphere.
Severity category (volume-based): Large.

Mean class confidence (model internal): 87.64%.

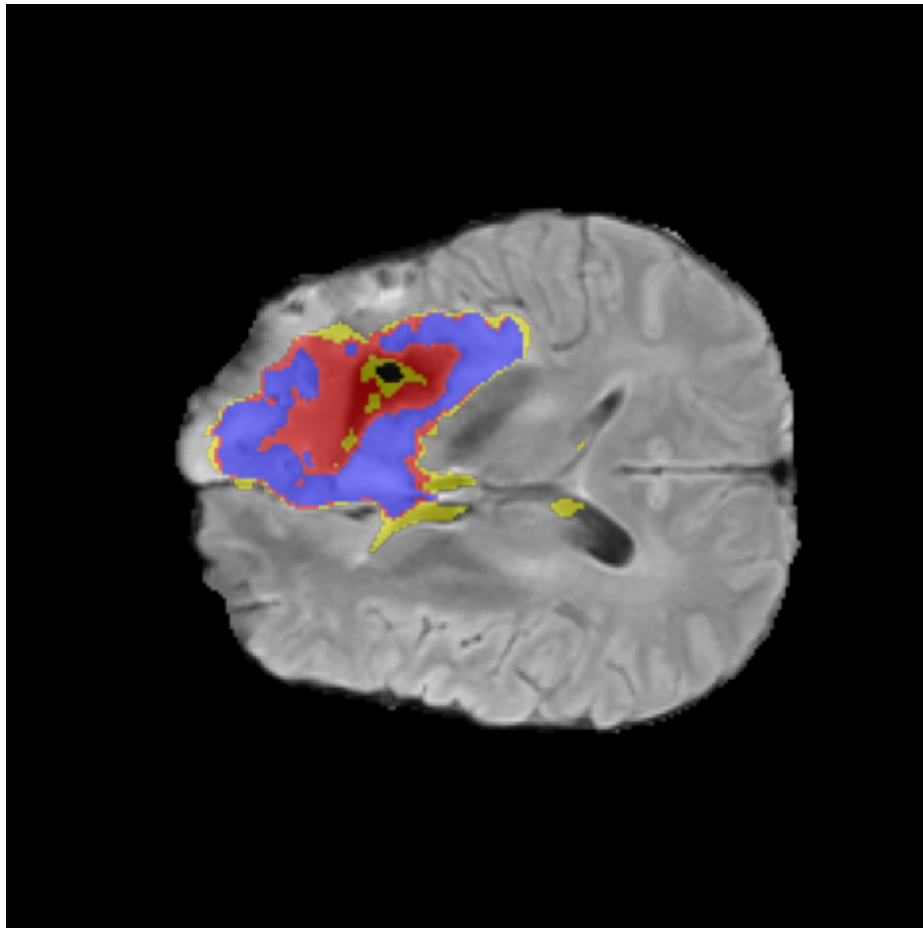

AI analysis

The quantitative summary reflects voxel-wise label assignments produced by the segmentation model (mean class confidence 87.64%). Histogram entries count voxels per discrete label id in the model output space.

Class histogram (voxel counts by discrete label): {"0": 8837873, "1": 23517, "2": 21055, "3": 45555}

Reference axial MRI (same slice index used for overlay visualization).

Model overlay: tumor-associated labels projected on the reference MRI (axial).

Conclusion

The automated read is positive for tumor-associated voxels with large estimated burden. Correlation with clinical findings and standard-of-care imaging is recommended.

Important: AI-generated report. Not a substitute for professional diagnosis.
